

Enterprise Software Ontologies
SAP Inside Track Bonn 2010

Bianca Borsan, Tobias Trapp

Agenda

Introduction

Where Are The Apps?

Ontologies for Software Architecture

Appendix: Standards

Use of Semantic Technology in Enterprise Architecture

Elements of IT Systems are

- **DATA**
- **FUNCTIONS**
- **KNOWLEDGE**

Use of Semantic Technology in Enterprise Architecture

And what about SAP?

- SAP Business Suite is an integrated system containing **DATA & FUNCTIONS**
- It's the task of Business Process Experts to make IT „intelligent“ by doing customizing, process orchestration and implementing business rules
- In other words: he adds the aspect of business **KNOWLEDGE** to ERP

Semantic Technologies add Aspects of Knowledge Management to ERP & NetWeaver

How can Semantic Technologies help?

- tagging, i.e. linking different data sources
- adding metadata to business objects for advanced process automation
- enabling collaboration
- visualization
- exploration & reasoning
- building repositories
- specification of domain models
- designing and checking business rules

Interesting article about the „Semantic Enterprise“:

<http://www.mkbergman.com/859/seven-pillars-of-the-open-semantic-enterprise/>

Agenda

Introduction

Where Are The Apps?

Ontologies for Software Architecture

Appendix: Standards

And is it really useful?

Semantic Technologies are used today:

- RSS 1.0 is based on RDF – it's the technological basis of newsfeeds of weblogs 
- Metadata of documents are coded using Adobe's XMP format – if you watch photos on flickr you will find geositions (where was the picture taken), at what time...
<http://www.adobe.com/products/xmp/>
- Used in expert systems: ontologies are formal representations of a set of concepts within a domain and the relationships between those concepts. We can use methods from AI to reason about the properties of that domain.

Ontologies are used to build expert systems that support the whole lifecycle of an insurance product

- Is a modelled insurance product valid according to the business rules of your company?
- Is there an insurance coverage in case of a damage event?
- Automated suggestions in upselling: should we offer a product to a customer?

You find an example at

<http://www.faktorlogik.de/doku.php?id=flogik:demosystem:demosystem>

Methods of Reasoning

- Classifications based on logical conditions including counting quantifiers (OWL)
- Rules (SWRL)
- Integrity Constraints (Open World vs. Closed World)

Ontologies are no Silver Bullet

- They are tools for expert users
- They require a deep understanding of the domain model
- So far I don't know any solution to express complex formulas (although I can refer to existing formulas of an business rule framework)

And What about SAP Business Suite?

These Tools are not used by within SAP ERP & Industry Solutions:

- FS-PM has it's own tools & infrastructure to model & implement insurance products as business objects
- FS-CM uses frameworks like BRF to „guide“ business processes
- FS-CD uses complex customizing for their calculations

I'm using Ontologies for my private historical Research Projects:

- In my „Stolperstein“ project I collect names of victims of national-socialism in Mainz.
- I extracted data of thousands of exilants from a database and converted them into an ontology - the result was a database independent format for semistructured data based on open standards.

IMHO every research project that gets public money should publish their results in standardized XML based formats made for knowledge management.

And How do we Build Semantic Apps?

There are a lot of commercial and open source tools in Java:

- Ontology editors like Protégé and Swoop
- Reasoners like Pellet
- APIs like Jena
- RDF stores and databases
- Semantic Wikis

A list of tools especially for ontologies: <http://www.mkbergman.com/862/the-sweet-compendium-of-ontology-building-tools/>

Agenda

Introduction

Where Are The Apps?

Ontologies for Software Architecture

Appendix: Standards

Use of Semantic Technologies in SAP Enterprise Architecture

You can use Semantic Technologies to

- visualize and explore the architecture of ABAP applications
- build repositories of systems & applications
- explore repositories by using methods of artificial intelligence

It is a tool for an application & enterprise architect

- architecting & doing change management,
- checking violations of architectural guidelines and
- putting his knowledge into a repository.

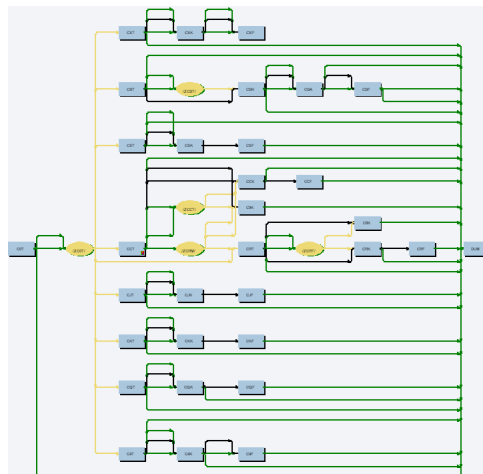

Status Quo

Current situation: information about systems, applications, software logistics are spread on different places:

- applications: SE80 (application hierarchy), excel sheets, bic pictures
- packages & dependencies: within SE80, on UML diagrams, PPT slides...
- software components: SLD, ST03, STMS...

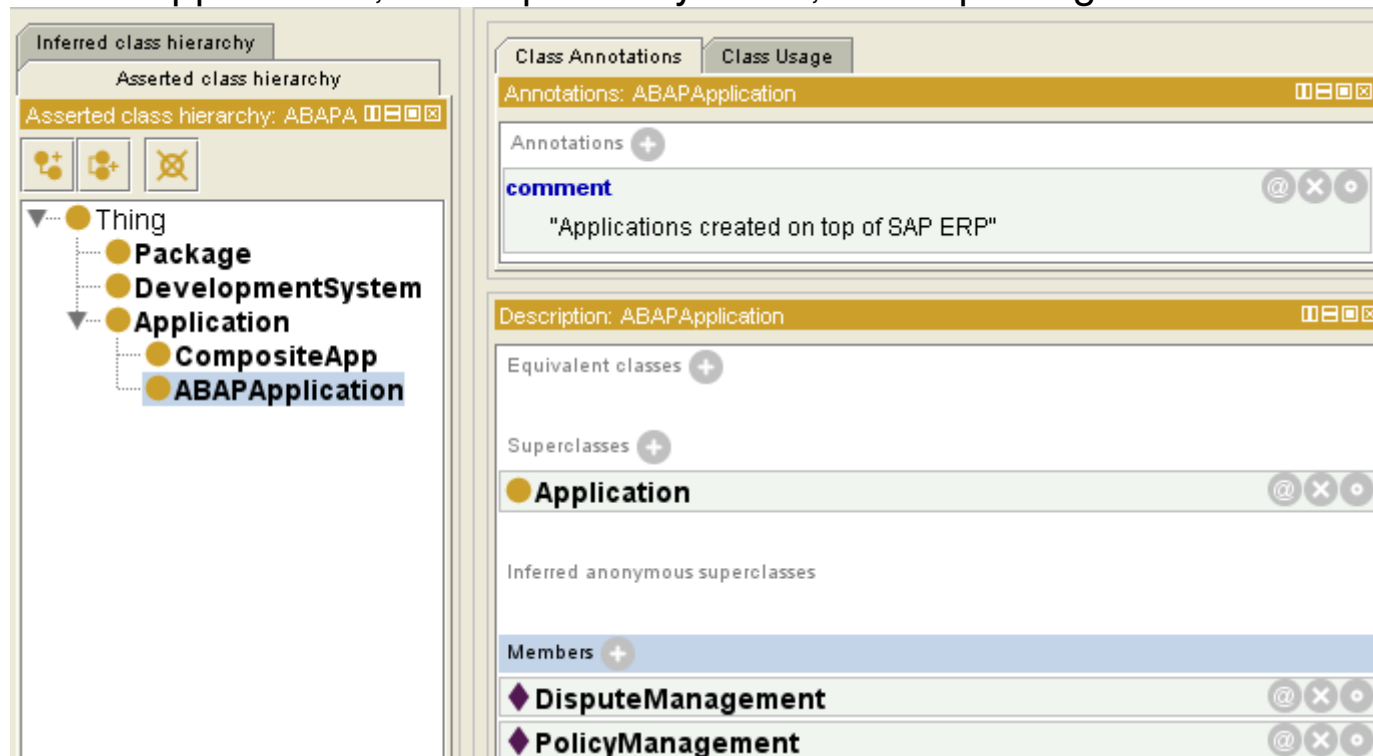

Paket		CRM	gesichert
		Eigenschaften	Verwendungserklärungen
Pakethierarchie		Pakete	Beschreibung
CRM_APPLICATION	Alle CRM Komponenten ohne spezielle Strukturpakete	✗	
_CRM_APPLICATION_DEFAULT	Default Schnittstelle für CRM Application	✗

Use Case: Repository of Applications

Maintain all Custom Applications of your IT landscape

- Define applications, development systems, ABAP packages...

The screenshot displays the SAP class browser interface. On the left, the 'Inferred class hierarchy' is shown, with the 'Asserted class hierarchy' for 'ABAPA'. The hierarchy includes: Thing (parent), Package, DevelopmentSystem, Application (parent), CompositeApp, and ABAPApplication (selected). On the right, the 'Class Annotations' and 'Class Usage' tabs are active. The 'Annotations' section shows a 'comment' annotation with the text: "Applications created on top of SAP ERP". The 'Description' section shows 'ABAPApplication' with 'Equivalent classes' and 'Superclasses' sections. The 'Superclasses' section lists 'Application'. The 'Members' section lists 'DisputeManagement' and 'PolicyManagement'.

Use Case: Dependencies Between Packages

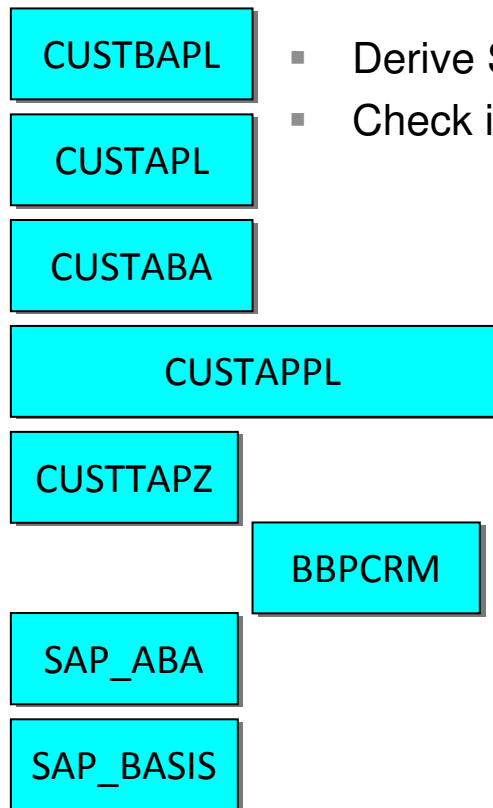

Applications are Developed in ABAP Packages

- When you are working with package hierarchies you and packages interfaces you have an explicit dependencies. Those can be defined when architecting or evaluated afterwards by scanning the DDIC & ABAP code.
- Using those methods you can analyse dynamic dependencies: publish & subscribe & BAdI interfaces for example.
- Just expose those data as (REST) web services giving back RDF data.
- Dependencies can be analysed using DL queries. Transitivity of dependencies is supported in OWL.

Use Case: Are SCs installable?

Melting Software Components in an Redesign Project

- Derive SC dependencies from package dependencies
- Check installation orders of SCs

The screenshot shows a software development tool interface with three main panels:

- Class Hierarchy:** A tree view showing a hierarchy starting with 'Thing', which includes 'Package' and 'SoftwareComponent'. 'SoftwareComponent' further includes 'UndefinedInstallationOrder' and 'WrongInstallationOrder'.
- Object Properties:** A panel titled 'Object properties: isLocatedIn' showing a list of properties including 'isLocatedIn' and 'dependsOn'.
- Rules Editor:** A panel titled 'Rules' containing three rule definitions:

```

      SoftwareComponent(?x) , SoftwareComponent(?y) ,
      hasOrder(?x, ?n) , hasOrder(?y, ?m) , equal(?n, ?m) ,
      differentFrom(?x, ?y) -> UndefinedInstallationOrder(?x)

      SoftwareComponent(?x) , SoftwareComponent(?y) ,
      dependsOn(?x, ?y) , hasOrder(?x, ?n) , hasOrder(?y, ?m) ,
      lessThan(?m, ?n) -> WrongInstallationOrder(?x)

      Package(?x) , Package(?y) , SoftwareComponent(?s) ,
      SoftwareComponent(?t) , isLocatedIn(?x, ?s) ,
      isLocatedIn(?y, ?t) -> dependsOn(?s, ?t)
      
```

Further Information

- The appendix of this talk contains information about used standards & use cases.
- I wrote a series of blogs about this topic:
 - <http://www.sdn.sap.com/irj/scn/weblogs?blog=/pub/wlg/13978>
 - <http://www.sdn.sap.com/irj/scn/weblogs?blog=/pub/wlg/14015>
 - <http://www.sdn.sap.com/irj/scn/weblogs?blog=/pub/wlg/14091>
 - <http://www.sdn.sap.com/irj/scn/weblogs?blog=/pub/wlg/14273>
- My XML book covers semantic technologies

Thank you for your Attention!

Agenda

Introduction

Where Are The Apps?

Ontologies for Software Architecture

Appendix: Standards

Semantic Web

- Vision of a web of data, a global database
- is structured information representation, that provide explicit semantic
- describes information and supports inferencing of new information
- its key enabler: the ontologies

What kind of data models manages Semantic Web?

- Text documents and data (e.g: Google's Index, Ebay's data base)
- XML documents with same vocabulary (e.g: Google API Web Service)
- RDF taxonomies with different vocabulary
- OWL ontologies and automatical conclusions

RDF

- Data Interchange and Data Integration (export data base in sets of statements)
- a RDF-Triple Pattern consists of statements like:
 - T (subject - resources addressed about URIs
predicate - properties of resources
object - resources or literals)
- Directed RDF-Graphs

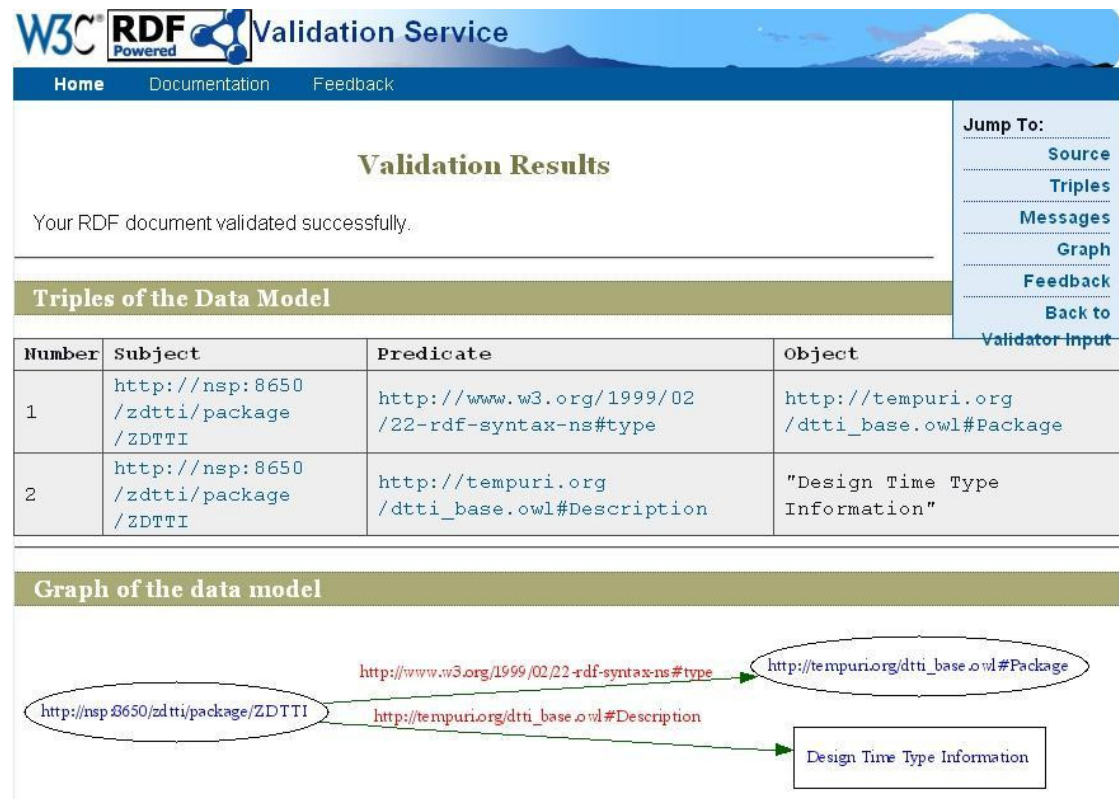

SPARQL

- extracts knowledge basis from RDF/RDFs
- allows transformations von RDF- data from one vocabulary to another
- explores RDF-Graphs using Select-statements and gives back as result a table:

e.g. `SELECT ?article ?author ?published`

RDF Validation Service: <http://www.w3.org/RDF/Validator/>

- *validate RDF*
- *explore triples*
- *explore RDF graph*

W3C **RDF** Powered Validation Service

Triples of the Data Model

Number	Subject	Predicate	Object
1	http://nsp:8650/zdtti/package/ZDTTI	http://www.w3.org/1999/02/22-rdf-syntax-ns#type	http://tempuri.org/dtti_base.owl#Package
2	http://nsp:8650/zdtti/package/ZDTTI	http://tempuri.org/dtti_base.owl#Description	"Design Time Type Information"

Graph of the data model

```
graph LR; S1("http://nsp:8650/zdtti/package/ZDTTI") -- "http://www.w3.org/1999/02/22-rdf-syntax-ns#type" --> S2("http://tempuri.org/dtti_base.owl#Package"); S1 -- "http://tempuri.org/dtti_base.owl#Description" --> L1["Design Time Type Information"];
```

RDF / XML

- RDF content is generated using XSLT and Transformations
- RDF data is integrated in XML / XHTML documents
- XML serialization allow us to use the whole XML Middleware

RDF

- RDF APIs (Jena)
- RDF Stores / Triple-Stores (Virtuoso)
- Basis for RSS 1.0, XMP (Adobe), SVG
- do not allow us to define classes
- are not able to describe relationships between them, only instances of a class

RDF(S)

- RDF-Schema specifies a data model for the RDF-statements
- abstract datatype (class)
- extends RDF with additional semantic features
- allows class definition, class hierarchies and restrictions

RDF(S)

- class disjunction problem
- restrictions of cardinality
- special properties:
 - transitivity
 - inverse
 - distinct / unique
- needs explicit semantic!

Use Cases of Semantic Web

- it enables new applications and functionalities
- has the ability to infer additional facts from provided facts
- will accomplish the vision of shareable data on the web

Ontologies

- are concept models that describe a domain
- enable the description of explicit semantic
- differentiate between terminological components (Tbox) and assertional components (Abox)
- the combination of Tbox vocabulary and Abox facts represent a knowledge base (KB)

Semantic building blocks:

- class, property, and individual constructs
- relationships between these constructs
- restrictions of properties for certain classes

OWL expressions can be formed from:

- class names (URIs)
- enumerations
- property-restrictions
- boolean combination of class expressions

OWL DL

- provides a Description Language (DL) that is based on RDF syntax and supports reasoning applications
- contains the whole OWL Full vocabulary with few restrictions that ensure that reasoning is computational and decidable in conception models
- supports complex classes, like enumerated classes, disjoint classes, and Boolean class expressions

SWRL

- support conjunctive queries (only instances) like:

e.g: „Which books were published by Springer and who wrote them?“

$\text{Book}(x) \wedge \text{publisheBy}(x, \text{Springer}) \wedge \text{Author}(x, y)$ antecedent \rightarrow consequent

- is not decidable – but there are decidable („DL safe“) subsets

RIF-RDF / RIF-OWL

- Interoperable semantic with Semantic Web knowledge base
- W3C RIF Working Group

http://www.w3.org/2005/rules/wiki/RIF_Working_Group
